EXPERIMENT 18

Prolog Program – Database with Name and DOB

Aim

To write and execute a Prolog program to create a database containing a person's Name and Date of Birth (DOB) and retrieve the stored information using queries.

Algorithm

1. Start the Prolog environment.
2. Define facts using the predicate person(Name, DOB).
3. Store the name and date of birth of different persons in the database.
4. Define a rule show_dob(Name, DOB) to retrieve the DOB of a person.
5. Load the Prolog program into GNU Prolog.
6. Give a person's name as input.
7. Prolog searches the database for the matching name.
8. Display the corresponding Date of Birth.
9. Stop.

Program

% Database of persons with Name and Date of Birth

person('Arun', '10-05-2002').

person('Bala', '15-08-2001').

person('Chitra', '22-12-2003').

```
person('Divya', '05-03-2002').
```

```
person('Kavin', '18-07-2001').
```

```
% Rule to find DOB using Name
```

```
show_dob(Name, DOB) :-
```

```
    person(Name, DOB).
```

Input

```
person('Arun', DOB).
```

```
person(Name, DOB).
```

Output

```
(16 ms) yes
| ?- person('Arun', DOB).
DOB = '10-05-2002'
yes
| ?- person(Name, DOB).
e DOB = '10-05-2002'
Name = 'Arun' ?
And
```

Result

Thus, the Prolog database containing Name and Date of Birth was successfully created and executed, and the required person's DOB was retrieved successfully using Prolog queries.
